Price lists - annexes

A row of white teepees is set up in a green grassy field. Several bare, dark trees are scattered around the teepees. The sky is blue with large, white, fluffy clouds. The overall scene is peaceful and natural.

**Why not be one with nature  
like the Indians?**

**We produce handmade Tee-Pees which are  
processed originally to the smallest detail and supplemented with leather.**

**BIZON-STANY®**  
výroba \* prodej \* pronájem

# Who we are?

- ❖ We are a bunch of enthusiasts and we are among the best manufacturers with many years of experience in the production of tents.
- ❖ We not only manufacture our tents, we also constantly build, transport and use them, some even in winter. The places where the tents are used differ in terms of climate, wind, soil, availability, and all of this constantly trains us and gives us the opportunity to adapt our production so that the tents are ready for any load and weather and are as durable as possible and suit the best in terms of practicality.
- ❖ We try to apply our knowledge and experience in production by improving from well-established standards.
- ❖ Thank you for your patronage and we will continue to surprise you with the quality and original design of our production.

**The Bison-tents team**

**BIZON-SHANY®**  
výroba \* prodej \* pronájem

# We can offer ...

**13 years on the market**

**Great variability**

Different sizes, lots of accessories.

**High resistance**

Durable materials with long term and weatherproof.

**Quality work**

**White or painted**

paint it with authentic symbols or on upon customer request.

**Own invention**

constantly improving functions and resistance by well thought modifications.

**BIZON-STANY**  
výroba \* prodej \* pronájem

# Where are our customers?

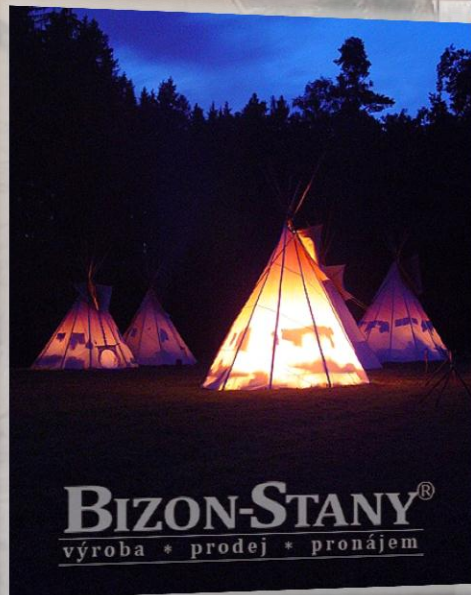

- ❖ The Tee-pee is a space in landscape.

- ❖ The Tee-Pee is weatherproof, warm and dry.

- ❖ You find freedom in the Tee-Pee.

- ❖ Tee-Pee is useable all year around.

**BIZON-STANY®**  
výroba \* prodej \* pronájem

# The Tee-pee consists of:

❖ Sheet (canvas)

❖ Poles

❖ Accessories

# SHEET/CANVAS

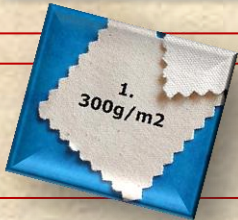

- ❖ **This sheet covers the top of the construction** made of poles of the Tee-Pee and closed by wooden buckles. The original Tee-Pee was made of buffalos skin, later made by handmade material. Nowadays we can choose from different types of fabrics depending on **seasonal and yearly use**.
- ❖ The resistance and the strength of the tent depends on the choice of fabric and also designs of each detail and the padding of strained part of the tent, which depend on the individual maker. All that has an **impact on the strength and lifetime of the Tee-Pee**.
- ❖ The Tee-Pee was different based on a native american tribe with specific details and the shape of the tent. We offer Tee-Pee **Dakota's tribe** which is most common.
- ❖ The sheet can be painted, see also **Painted Tee-Pee**.
- ❖ The fabric door is part of the sheet and is also the entrance.

# CANVAS

## Standard fabrics – for *seasonal use*

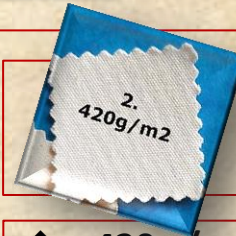

- ❖ The fibers are obtained from natural sources (plants and animals) and then processed into textiles for various purposes.
- ❖ Gray fabric - is created by leaving a coarser fiber during processing and then this fabric undergoes hydrophobic (against water) and fungicidal (against mold) treatment.
- ❖ Whether the fabric strength is 300g / m<sup>2</sup> to 600g / m<sup>2</sup>, they are natural fabrics and their durability is adapted to the frequency and length of use, which results in thinning and wear of the fabrics.
- ❖ To protect the fabric drying of the tent is recommended and then restoring impregnation.
- ❖ The rule here is that the thicker the fabric, the longer it will last, and conversely, the thicker the material, the longer it has to dry. Therefore, to prevent the formation of mold, the fabric must be completely dry in the case it got exposed to moisture or before storing it away. And it can take much longer to dry than any polyester tent, because cotton absorbs water.

# STANDARD FABRICS – for *seasonal use*

## Fabric No. 1

- ❖ **300g / m2** - the fabric is used for summer short-term camping, tents made of this fabric are light and allow easier transport.
- ❖ **100% cotton** in a gray design (natural white color), provided with a hydrophobic treatment (against water) and a fungicidal treatment (against mold).
- ❖ Due to their characteristics, tents made of pure cotton are more prone to the formation of mold, because they absorb far more moisture than mixed or polyester fabrics, which is why these fabrics are suitable for summer use on sunny days at the camp.
- ❖ For these fabrics, impregnation treatment is required about once every 1-2 years.
- ❖ Expected life span 4-5 years depending on use.
- ❖ **Color:** natural white (gray).

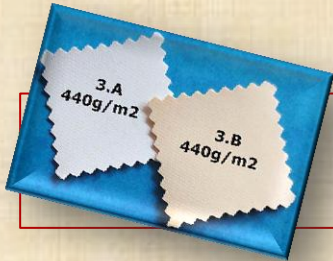

## Fabric No. 2

- ❖ **420g / m2** - fabric suitable for long-term summer use.
- ❖ **50% cotton and 50% polyester** in gray (natural white color), provided with a **hydrophobic** treatment (against water) and a **fungicidal** treatment (against mold).
- ❖ Poly-cotton is a hybrid between synthetic polyester and cotton. In essence, it is a blend of cotton and polyester fibers, and this combination makes the fabric more resistant to mold than pure cotton fabric. Polyester also helps reduce the risk of large cracks.
- ❖ For these fabrics, impregnation treatment is required about once every 2 years.
- ❖ Expected life span 5-6 years depending on use.
- ❖ **Color:** natural white (gray).

# Fabrics for year-round use

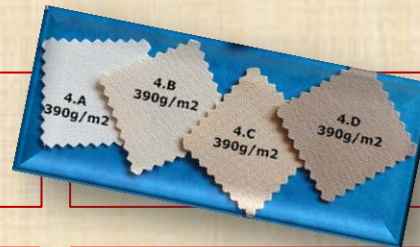

- ❖ We also offer fabrics for year-round use, which we import.
- ❖ These fabrics are among the high quality, very strong, durable and verified fabrics, and therefore suitable for those customers who want true quality and durability.
- ❖ The fibers are formed from melts and are technically modified for the given purposes. Due to their composition, such fabrics do not shrink to such an extent and are more abrasion resistant than cotton.
- ❖ The big advantage is that they are not moldy and are almost or completely waterproof.
- ❖ Many people have a hard time remembering that polyester as a tenting material is something barbaric against ethics. Times are changing and inorganic polyester fibers have gained in quality and offer better conditions of use than cotton and are often unrecognizable from cotton. Unlike cotton, however, they do not shrink, dry faster, smell less after the fire has started, and certainly do not melt, as some people mistakenly believe.

# FABRICS for year-round use

**Fabric No. 3**

- ❖ **440g / m2** - fabric ideal for permanent, year-round use.
- ❖ **100% polyester fabric (PES)** from a 50% textile weave, which has a 50% PVC coating with a water-repellent finish (W / R) applied on the outside (back). This fabric definitely does not have a natural look, but is characterized by high resistance to weather conditions, as well as the sunlight. It is a very durable and quick-drying, strong fabric, the best properties of which include resistance to moisture. Due to its composition, this fabric does not absorb any moisture, does not mold and, most importantly, does not need to be impregnated. The fabric is maintenance-free and in recent years the most in demand for its properties - we have been using it successfully for several years.
- ❖ No impregnation is required for these fabrics.
- ❖ Expected life span 6-8 years with year-round use.
- ❖ **Color:** A) white, B) cream

**Fabric No. 4**

- ❖ **390g / m2** - great fabric for permanent, year-round use.
- ❖ **PES (Polyethersulfone)** one of the leading solution and UV stabilized PES fabrics on the market. The surface of the fabric has the structure of a textile fabric and is treated on the inside with an acrylic coating with integrated special PVA fibers improving the breathability of the material. This fabric is very pleasant to the touch and has a mold-repellent finish, has a high water resistance, repels dirt and oil, and is permanently resistant to seawater and climate. We recommend this material to customers with the highest demands. It is an ideal material for permanent year-round use.
- ❖ Very high tear / tear resistance.
- ❖ For these fabrics, impregnation treatment is required about once every 3 years.
- ❖ Expected life span 6-8 years with year-round use.
- ❖ **Color:** A) white, B) light beige, C) beige, D) dark beige.

# Fabrics

## Differences and description

### Standard fabrics for seasonal use

#### No.1, 300 gr/m<sup>2</sup>

- ❖ The fabric is suitable for camping in the summer, it's light and allows easier transport.
- ❖ **Composition:**  
100% cotton hydrophobic treatment fungicide treatment
- ❖ **Tech. parameter:**  
Water column 30 cm/1 m<sup>2</sup>  
Warp 785 N  
Shot 600 N  
Permeability 3,2 kPa
- ❖ **Color:**  
natural white (gray)
- ❖ **Maintenance:**  
Treat with impregnation as needed.  
Expected life span of 4-5 years.

#### No. 2, 420 gr/m<sup>2</sup>

- ❖ The fabric is suitable for long-term use in the summer.
- ❖ **Composition:**  
50% Cotton  
50% Polyester  
hydrophobic treatment  
fungicide treatment
- ❖ **Tech. Parameter:**  
Water column 35 cm/1 m<sup>2</sup>  
Warp 1200 N  
Shot 600 N  
Permeability 3,5 kPa
- ❖ **Color:**  
natural white (gray)
- ❖ **Maintenance:**  
Treat with impregnation as needed.  
Expected life span of 5-6 years.

# Fabrics

## Differences and description

### Fabrics for ALL YEAR ROUND use

#### No. 3, 440 gr/m<sup>2</sup>

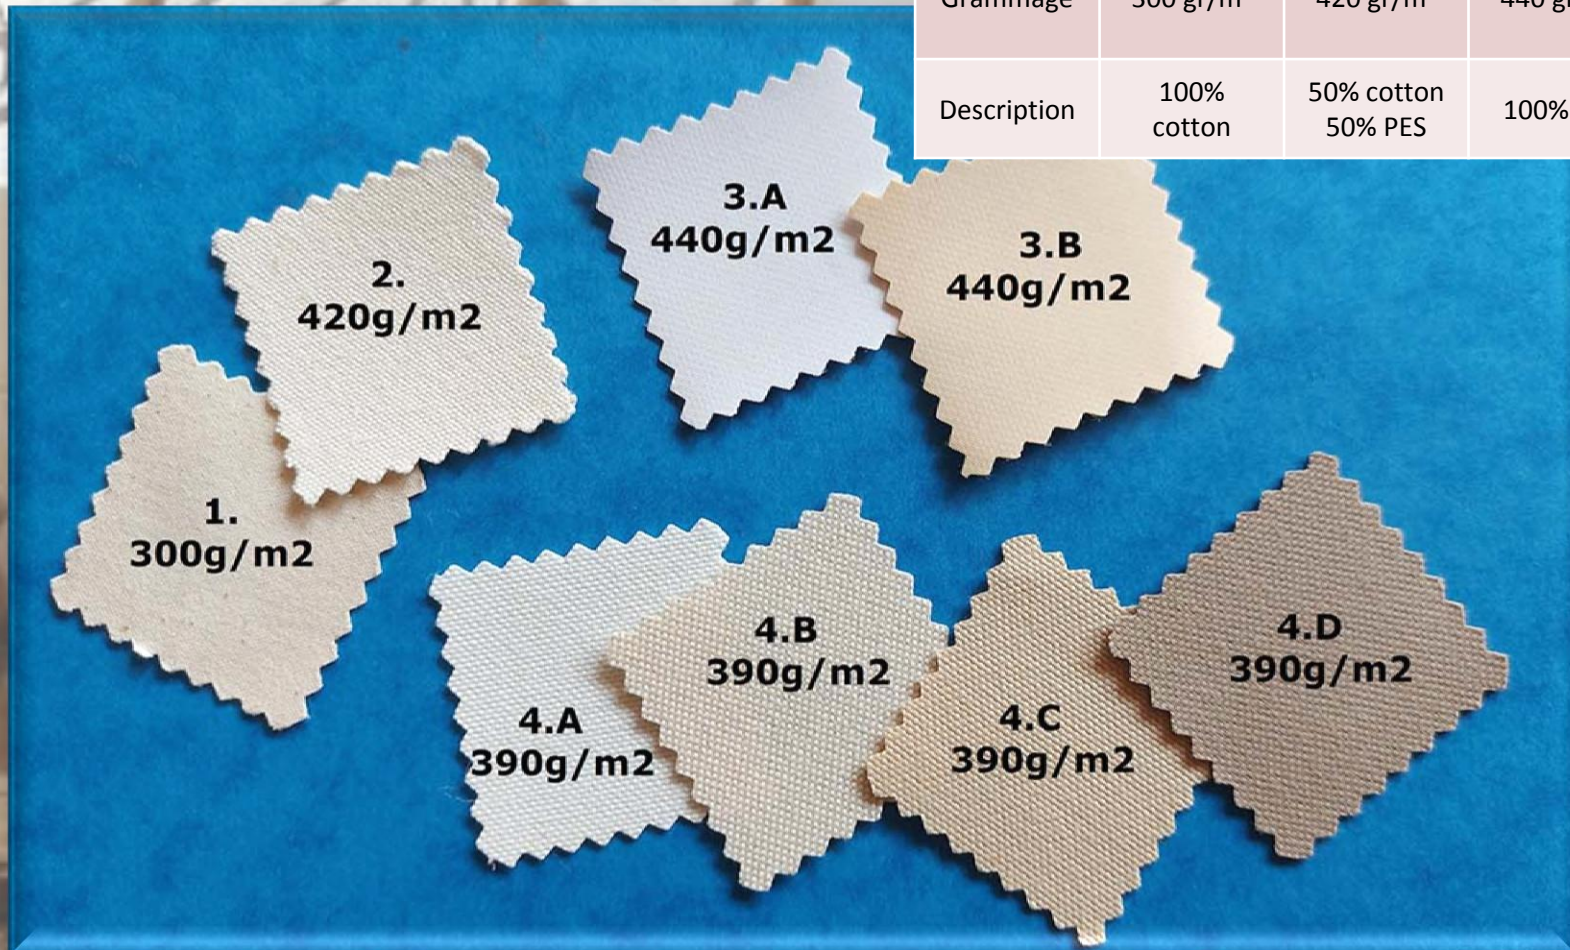

- ❖ The fabric is suitable for all year-round use.
- ❖ **Composition:**  
100% Polyester  
50% woven layer  
50% fabric coating  
W/R
- ❖ **Tech. Parameter:**  
Water column 100 cm/1 m<sup>2</sup>  
Warp 1440 N  
Shot 1240 N  
Impermeable 0 kPa
- ❖ **Color:**  
A) white, B) cream
- ❖ **Maintenance:**  
Maintenance-free material for the entire life span.  
Expected life span 6-8 years.

#### No. 4, 390 gr/m<sup>2</sup>

- ❖ The fabric is suitable for all year-round use.
- ❖ **Composition:**  
100% polyester with acrylic coating on the inside hydrophobic treatment bacterial treatment, does not stain W / R treatment
- ❖ **Tech. parameter:**  
Water column 80 cm/1 m<sup>2</sup>  
Warp 2300 N  
Shot 1400 N  
Impermeable 0 kPa
- ❖ **Color:**  
A) white, B) light beige, C) beige, D) dark beige
- ❖ **Maintenance:**  
Treat with impregnation as needed.  
Expected life span 6-8 years.

# Door

We offer two kind of doors A or B or C and it is possible to have it painted. This option is most often used.

Through a suitable painted motif you can improve the overall look of the Tee-Pee.

This option A is most often used. The door is attached to the entrance from the outside.

This door B is american style from the inside. It is suitable for all around year use.

Door C (zip closure)  
They have the same use as door B (American).  
This door have stitched zipper in the middle that allows us easier access to the tent. Suitable for all year round usage.

# POLES

- ❖ Poles form the base structure of the tent and to build a tee-pee we use at least 1 meter longer poles than the height of the tent.
- ❖ Poles have to be thin and straight, these are made of trees such as spruce and pine.
- ❖ The best poles are without tree bark, they are knot free and branch free.
- ❖ It prevents damage to the tent cover.

# We offer two types of poles: A (peeled) and B (milled).

## A) Peeled poles

- ❖ Peeled poles come in sizes from 5 to 9 meters and only **as whole**, made out of pine wood. The poles can be varnished upon request, which protects them from dirt, dampness, mould and insects.
- ❖ **Advantage:**  
Their thickness is symetrically slim along the whole pole and makes them flexible.
- ❖ **Disadvantage:**  
their length is therefore difficult to transport.

## B) Milled poles

- ❖ Poles are machine made, they are perfectly smooth and their end is made to gradually slimming spike.
- ❖ Thanks to the accurate symetry, the poles can be set in the middle by a metal thinwall clutch.
- ❖ Adapting poles are sizes 5 to 9 meters.
- ❖ **Advantage:**  
They are easily connected and are smoothly transported. As an advantage, they dont bend easily which is good especially for longer poles.

# Accessories

**Accessories consists of:**

- ◆ + 2 wooden poles to stretch fabric door
- ◆ + 1 rod to fasten flap string, very strong rope to tie up rods
- ◆ + needle to close the tent
- ◆ + pegs

## **Pegs**

- ◆ Pegs are very important part of the tent, they base and stretch the sheet of Tee-Pee. Pegging must be strong to resist any kind of wind.
- ◆ The pegs should be hard wood so they won't split when hammered. Length about 30 cm and 3-5 cm in diameter for smaller tent sizes and 50 cm for larger sizes. For the largest tipi sizes of 8-9 m, really strong anchoring with metal pins (length 60 cm) is necessary, which the wind will not simply pull out of the ground - this will prevent the tarpaulin from loosening.

# Pegs

We offer two types of Pegs: A (wooden) and B (Metal).

## A) Wooden pegs

These wooden pegs are made of wood from deciduous

Trees ; the surface is waxed, with a groove to hold a loop.

## B) Metal pegs

❖ Metal Pegs, unlike the wooden one, could be hammered all the way in the ground and **nobody can trip over them.**

They are used by schools and nurseries so **kids wont get hurt,therefore it is safer.**

❖ Another advantage is that **in the winter you can also hammer them into the ground** and they last longer than wooden pegs.

# Rod pads

- ❖ Rod pads are important under the ends of rods. Pads are made of hard wood and are made to prevent breakage. The pad has a hole for metal pegs to guarantee stability.
- ❖ Rods are properly fixed and don't move in case of strong wind and the sheet of the tent stays straight and won't loosen.
- ❖ Another advantage is that the rods do not sink into the ground, it isolates them from the ground.
- ❖ **It is an important and necessary part for usage throughout the year.**

# Lining – inner sheet

- ❖ It is an inner sheet or so called insulating sheet that surrounds the whole tent, it hangs approximately 2 meters above the ground. It forms a gap in the bottom part and lies approximately 15-20 cm from the ground and fills up the space between ground and bottom part of the tee-pee.
- ❖ The bottom part of tee-pee is not pegged to the ground but slightly above, helping the fire to get air flow.
- ❖ Lining lays directly on the ground, it stops the wind from coming through. The air circulates between the sheet and the lining.

## *Advantages of Lining:*

- ❖ The gap between the sheet and the lining has a better airflow that promotes smoke exhausting and hot air in the summer heat.
- ❖ Another advantage is that it stays dry and it does not collect morning dew. At night, lining can be dragged over the entrance opening to seal the door perfectly.
- ❖ At the same time, it increases the aesthetic appearance because it partially covers the bottom of the bars, creating a double wall and better insulation. It also keeps the heat and in the case of strong wind does not create a draught.
- ❖ The Lining is essential for winter living and, regardless of the season, it creates a real comfort of home.

# Ozan – roof sheet

- ❖ Ozan is used to maximize comfort and protects against raindrops, those can get inside through rods. It protects the warm from the fire escaping.
- ❖ Ozan has fixed to the roof, hanging above lining. We fix ozan by a string by wrapping it around top part of the poles, inside the tent, approximately at 2,5 meters high.
- ❖ Every manufacturer has a different design, size and way to manufacture it.

We offer two variants of ozan:

- ❖ A) Ozan covers over  $\frac{1}{2}$  of the Tee-Pee
- ❖ B) We offer also longer version.
- ❖ When you have A+B it is actually two ozanas that overlap, so that the entire space is covered and a gap is created for smoke evacuation, which is located between the ozanas.
- ❖ When using ozan **A/B** the interior gets well protected against the rain, as raindrops could easily get inside if the flaps are not closed properly.
- ❖ **It is recommended especially when using wooden floor.**
- ❖ **Important:** Tee-Pee is a current asset, therefore it has to be looked after, especially making sure it is always stretched. Water collected by ozan has to be regularly thrown away. These rules are a must for better and longer lasting usage.

# Tee-pee hat

It is an alternative way to prevent raindrops from getting inside as they can get in even after closing the flaps. There is a hat on top of the poles, these have to be shortened in case, to prevent water leaks. It is the cheaper version of protection than ozan but not everybody likes it.

A rain cap is basically simple round piece of cloth which is thrown over the top of the poles to prevent seepage into tipi. Your order also includes a rope, which you will need and pegs to anchor.

# Floor

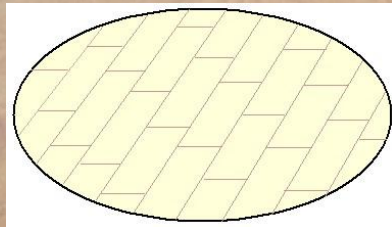

- ❖ Indians used to lay buffalo skin and remains of old tee-pee or old rugs.
- ❖ It can be filled up with a grit.
- ❖ **We can offer flooring only if assembly is purchased, as they need to be isolated as this can be only done at customer.**
- ❖ Insulation is offered for wooden floors sizes 5, 6, 7, 8, 9 meters.
- ❖ The type of flooring is optional based on your own choice.
- ❖ As standard we offer option A (floor from OSB boards).
- ❖ The base construction for flooring is made of wood.
- ❖ The bottom part of the floor is isolated. In case of need, the floor can be dismantled and moved, but it is advisable to have it built permanently.

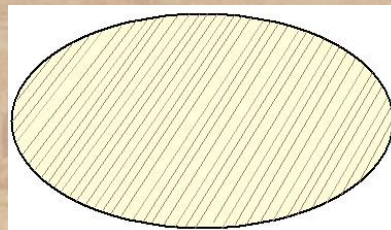

We offer 3 types of floor:

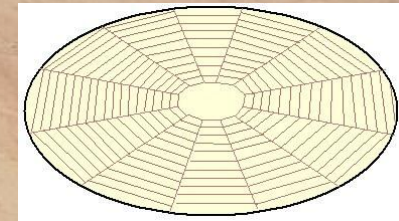

A) Floor from OSB – boards

B) Wooden floor – type 1

C) Wooden floor – type 2

„Your mind must be like a teepee. Leave the partition at the entrance open to let fresh air in and blow away the smoke of confusion.“

*Eagle of the Teton Sioux*

It counts as one of the best tents, which offers comfortable and unforgettable camping. This tent is easily built, is spacious and in the middle you can light up a fire, which is not only pleasant but also practical while camping in winter.

**You should experience it.**

A large, light brown silhouette of a bison is positioned in the background, facing right. It serves as a watermark for the presentation.
